Understanding Soil Fertility and Testing

Why is soil fertility important?

Why should we care about how much is being applied?

Too Little vs Too Much

Why is testing important?

Soil Testing – identifying “what’s in the bank”

- Soil test results relate to the probability that adding fertilizer will increase yield
- Soil testing has been proven reliable for pH, P, K, and Zn, but not very reliable for the other nutrients
- Soil testing isn’t reliable for N; because of variable weather, biological and chemical processes that are constantly occurring in the soil.
- Ideally want to test at least once per crop rotation.

Crops don't care where the fertilizer comes from...

- Fertilizer
- Soil
- Manure
- Organic sources
- Sewage sludge

...as long as they get what they need when they need it.

Understanding Soil Fertility and Testing

- 1. Definitions & crop nutrient removal**
2. Soil sampling and Why it's important
3. Send soil samples to a certified lab
4. Reading the soil test & interpret recommendations
5. Secondary and micronutrients
6. Soil pH and lime recommendations

Definitions

- Soil test results for nutrients are provided in **ppm**
 - ppm P, where P = phosphorous
 - ppm K, where K = potassium
- Fertilizer recommendations are provided as **lb/ac**
 - lb/ac P_2O_5 , where P_2O_5 = phosphate
 - lb/ac K_2O , where K_2O = potash
- Fertilizer is sold as phosphate and potash

169022	ANS	10	0	0	0	n/a	n/a	2	0	0	400

NOTE: For nitrogen recommendations, explanation of lime recommendations and estimated crop removal, please see enclosures.

Definitions

- Fertilizer analysis is a % of each nutrient
 - %N - %P₂O₅ - %K₂O
 - If more #'s, the 4th is sulfate, the 5th is zinc
 - Often include an abbreviation of the nutrient
 - i.e. S = sulfur and Zn = zinc
 - Cannot add up to more than 100%

Definitions

- Common forms of phosphorus fertilizer:
 - MAP = Monoammonium Phosphorus = 11-52-0
 - DAP = Diammonium Phosphorus = 18-46-0
- Most common form of potassium fertilizer:
 - KCL = Potassium Chloride (Potash) = 0-0-60

Definitions

- Pounds of fertilizer per acre = # of pounds of the complete product applied per acre
- Units of fertilizer = used more frequently to describe the # of pounds of the nutrient (i.e. phosphate, potash) applied per acre.

Example:

I wanted to apply 60 units of potash (K_2O) per acre. To get that I needed to apply 100 pounds of 0-0-60 fertilizer.

Applying definitions

- You want to apply 15 lb/ac sulfur on your corn crop. Product choices include Ammonium sulfate (21-0-0-24), which is 24% sulfur; and Calcium sulfate (aka gypsum) (0-0-0-18) which is 18% sulfur. How much of each product would you use?
 - ✓ **AMS:** $15 \text{ lb/ac} \div 0.24 = 62 \text{ lb/ac AMS}$, which also provides 13 lb/ac N
 - ✓ **Calcium sulfate:** $15 \text{ lb/ac} \div 0.18 = 83 \text{ lb/ac CaS}$

Crop Removal

- Estimate crop nutrient removal with Table 2 in PM 1688

PM-1688

Table 2.

Page 4.

Google the publication or go to:

<https://store.extension.iastate.edu/Product/5232>

Table 2. Nutrient concentrations to calculate removal amounts of P_2O_5 and K_2O in the optimum soil-test category.

Crop †	Unit of Yield and Moisture Basis	Pounds per Unit of Yield ‡	
		P_2O_5	K_2O
Corn	bu, 15%	0.32	0.22
Corn silage	bu grain equiv., 15%	0.44	1.10
Corn silage	ton, 65%	3.5	9.0
Corn stover	ton, 15%	4.8	18
Soybean	bu, 13%	0.72	1.2
Soybean residue	ton, 10%	4.7	23

Example: Corn

- 200 bu/ac corn at 15% moisture would remove:
 - P_2O_5 : $0.32 \text{ lb } P_2O_5/\text{bu} \times 200 \text{ bu/ac} = 64 \text{ lb } P_2O_5/\text{ac}$
 - K_2O : $0.22 \text{ lb } K_2O/\text{bu} \times 200 \text{ bu/ac} = 44 \text{ lb } K_2O/\text{ac}$

Perennial ryegrass	ton, 15%	11	30
Sorghum-sudan	ton, 15%	11	33

PM-1688

Table 2.

Page 4.

Google the publication or go to:

<https://store.extension.iastate.edu/Product/5232>

Table 2. Nutrient concentrations to calculate removal amounts of P₂O₅ and K₂O in the optimum soil-test category.

Crop †	Unit of Yield and Moisture Basis	Pounds per Unit of Yield ‡	
		P ₂ O ₅	K ₂ O
Corn	bu, 15%	0.32	0.22
Corn silage	bu grain equiv., 15%	0.44	1.10
Corn silage	ton, 65%	3.5	9.0
Corn stover	ton, 15%	4.8	18
Soybean	bu, 13%	0.72	1.2
Soybean residue	ton, 10%	4.7	23
Oat	bu, 13%	0.29	0.19

Example: Soybeans

- 50 bu/ac soybeans at 13% moisture would remove:
 - P₂O₅: 0.72 lb P₂O₅/bu x 50 bu/ac = 36 lb P₂O₅/ac
 - K₂O: 1.2 lb K₂O/bu x 50 bu/ac = 60 lb K₂O/ac

Perennial ryegrass	ton, 15%	11	30
Sorghum-sudan	ton, 15%	11	33

PM-1688

Table 2.

Page 4.

Google the publication or go to:

<https://store.extension.iastate.edu/Product/5232>

Table 2. Nutrient concentrations to calculate removal amounts of P₂O₅ and K₂O in the optimum soil-test category.

Crop †	Unit of Yield and Moisture Basis	Pounds per Unit of Yield ‡	
		P ₂ O ₅	K ₂ O

Example: Alfalfa

- 2 tons/ac alfalfa at 15% moisture would remove:
 - P₂O₅: 13 lb P₂O₅/bu x 2 ton/ac = 26 lb P₂O₅/ac
 - K₂O: 43 lb K₂O/bu x 2 ton/ac = 86 lb K₂O/ac

Sunflower	100 lb, 10%	0.75	0.65
Alfalfa, alfalfa-grass	ton, 15%	13	43
Red clover-grass	ton, 15%	11	31
Trefoil-grass	ton, 15%	11	31
Smooth brome-grass	ton, 15%	7.9	41
Orchardgrass	ton, 15%	12	60
Tall fescue	ton, 15%	11	58
Timothy	ton, 15%	7.9	28
Perennial ryegrass	ton, 15%	11	30
Sorghum-sudan	ton, 15%	11	33

Looking at Crop Removal Rates

- 200 bu/ac corn removes 64 lbs P and 44 lbs K
- 50 bu/ac soybeans removes 36 lbs P and 60 lbs K
- 2 tons/ac alfalfa removes 26 lbs P and 86 lbs K
- Lots of “withdrawals from the bank”
- At a minimum we should be replacing these amounts

Maximize Economic Returns to Fertilizer Inputs

1. Definitions & crop nutrient removal
2. **Soil sampling**
3. Send soil samples to a certified lab
4. Reading the soil test & interpret recommendations
5. Secondary and micronutrients
6. Soil pH and lime recommendations

2. Soil sampling

- A sample should represent an area of a field under similar conditions:
 - grid or zone sampling
 - make use of yield maps
 - soil map units (SMU), slope, drainage, crop history, manure, proximity to gravel road, etc.
- Absolute minimum of 10 cores per sample, prefer 12 to 15 cores per sample, and more cores per sample if there is more field variability (*i.e.* banding fertilizer).
- Sampling depth of 6” for corn/ soybean; 2-3” for pastures

Take a Good Soil Sample to Help Make Good Fertilization Decisions

One of the most important steps in soil testing is collecting soil samples. The soil sample is the first part of the soil testing process and the foundation for information derived from laboratory analyses, soil test interpretations, and recommendations. Soil sampling is also the largest and most common source of errors in the soil testing process. Remember why soil samples are being taken – to obtain information on which recommendations and decisions concerning fertilizer, manure, and limestone application can be based.

A comprehensive soil fertility and organic matter map for each field is desirable as a basis on which to adjust fertilizer, manure, and limestone application. Over- or under-treatment may reduce profits, cause nutrient supply issues, or increase chance of negative impact on water quality. Informed decisions can be made only if soil samples are representative of the areas sampled and accurately reflect differences in the field. Remember that just a few cores with a very small amount of soil will represent an area of the field. It is essential to select uniform areas to collect cores, and not mix contrastingly different field conditions into a sample, such as different soil series, slope, erosion, old fence rows, potholes, knolls, or nearby limestone roads.

When to sample

The best time to sample is during the time of the year for which soil test methods are calibrated, when there is time for good nutrient planning after receiving soil test results from the lab, and when the soil conditions allow for collecting good samples. Ideally, the best time would be after harvest and before fertilization. Do not sample shortly after a lime, fertilizer, or manure application or when the soil is excessively dry or wet.

Sampling at other times such as in the winter, and especially with frozen soil, is discouraged because results are not consistent with

recommended sampling times and cannot be used with suggested interpretations. Field research calibrations for phosphorus (P), potassium (K), and pH soil tests are based on samples collected in the fall or spring. Recent research suggests that samples taken in late spring or early summer, before around the V6 growth stage of corn or soybean, and when P, K, or lime were not applied in the spring or the previous fall, can provide reliable results. Sampling at this time is too late to efficiently fertilize the current crop, but test results can be used for fall applications when combined with current year yields for estimating P and K removal.

Sampling using soil maps and management zones

Each sample should represent a uniform field area with similar past management. The sampling area should also represent a field area, or management zone, that can be managed in a similar fashion in regard to nutrient or limestone application and perhaps other crop production practices or inputs. Delineating separate crop management zones and soil sampling zones does not make sense if the entire field will be managed as a whole unit no matter the test results. Long histories of fertilizer, limestone, or manure application, especially with high application rates, may mask natural soil fertility differences due to soil properties and landscape position. However, organic matter levels are still closely related to soil map units. This is shown in Figure 1 where organic matter levels range from 1.5 to 10 percent in an 80-acre tract in the Clarion-Nicollet-Webster soil association. Soil pH patterns across fields sometimes are still dominated by variation of inherent soil properties rather than management of nutrient or limestone application. Examples are certain fields with the Clarion-Nicollet-Webster soil association and in far west-central Iowa which contain soils with free lime (calcium carbonate).

Take a Good Soil Sample to Help Make Good Fertilization Decisions

Soil Survey

Progressed from book to disc to on-line with the Web Soil Survey

All future soil survey information will only be available on the Web Soil Survey

The screenshot shows the Web Soil Survey website interface. At the top, there is a banner with the USDA logo and the text "United States Department of Agriculture Natural Resources Conservation Service". Below the banner is a navigation menu with links for "Home", "About Soils", "Help", and "Contact Us". The main content area features a search bar with the text "Enter Keywords" and a "Go" button. Below the search bar is a "Browse by Subject" menu with links for "Soils Home", "National Cooperative Soil Survey (NCSS)", "Archived Soil Surveys", "Status Maps", "Official Soil Series Descriptions (OSD)", "Soil Series Extent Mapping Tool", "Geospatial Data Gateway", "eFOTG", "National Soil Characterization Data", "Soil Quality", and "Soil Geography". The main content area also features a "START WSS" button and a "Welcome to Web Soil Survey (WSS)" section. The "Welcome" section includes a photograph of people working in a field and a paragraph of text. Below the "Welcome" section is a "Four Basic Steps" section with a "1 Define" step and a "Area of Interest (AOI)" section. The "Area of Interest (AOI)" section includes a photograph of a map and a paragraph of text. On the right side of the page, there are two sections: "I Want To..." and "Announcements/Events". The "I Want To..." section includes links for "Start Web Soil Survey (WSS)", "Know the requirements for running Web Soil Survey", "Know the Web Soil Survey hours of operation", "Find what areas of the U.S. have soil data", "Find information by topic", "Know how to hyperlink from other documents to Web Soil Survey", and "Know the SSURGO data structure". The "Announcements/Events" section includes links for "Web Soil Survey 3.2 has been released! View description of new features and fixes.", "Web Soil Survey Release History", and "Sign up for e-mail updates via GovDelivery". At the bottom of the page, there is a "I Want Help With..." section with links for "Getting Started With Web Soil Survey" and "How to use Web Soil Survey".

Tips for using the Web Soil Survey

- ISU Ag Decision Maker provides a tutorial for using Web Soil Survey to “Compute the Iowa Corn Suitability Rating for Your Farm,”
<https://www.extension.iastate.edu/agdm/wholefarm/html/c2-87.html>
- YouTube provides some “how-to” videos for using Web Soil Survey. Here is one:

Anhydrous Ammonia Regulation

What do you need to soil test for?

- Soil pH and buffer pH - for all crops, plus useful for some herbicide choices and rates
- P - for all crops
- K - for all crops (oven-dry or field-moist/slurry “wet” test)
- OM correlates to S and also is useful for some herbicide choices and rates
- Zn for corn mainly on calcareous or low OM soils
- B for alfalfa on low OM soils
- Soil tests for Ca, Mg, S, Fe, Cu, Mn; not reliable for making recommendations.

Returns to Cost of Fertilizer

Percent of P and K fertilizer applications expected to produce a yield response with soil test levels that are:

Very Low	80%
Low	65%
Optimum	25%
High	5%
Very High	<1%

For long-term profitable crop production, maintain in the optimum category.

For soil test levels in the optimum category, fertilize for crop removal.

Maximize Economic Returns to Fertilizer Inputs

1. Definitions & crop nutrient removal
2. Soil sampling
3. Send soil samples to a certified lab
- 4. Reading the soil test & interpret recommendations**
5. Secondary and micronutrients
6. Soil pH and lime recommendations

4. Read the soil test & interpretation recommendations

- Recommendations are provided as lb/ac of nutrient i.e. phosphate (P_2O_5), potash (K_2O).
- Certified labs are NOT required to use ISU fertilizer recommendations.
- Find the corresponding table in PM-1688 for the crop nutrient recommendations and needs

Table 3. Phosphorus and potassium recommendations for corn grain production.

Phosphorus Dry or Field-Moist and Slurry Soil Tests (ppm)					
Soil Test Category	Very Low	Low	Optimum*	High	Very High
Bray P₁ and Mehlich-3 P	0–8	9–15	16–20	21–30	31+
Olsen P	0–5	6–9	10–13	14–18	19+
Mehlich-3 ICP P	0–15	16–25	26–35	36–45	46+
P₂O₅ to apply (lb/acre)					
	100	75	58	0	0
Potassium Soil Tests (ppm)

Ammonium Acetate and Mehlich-3 Extractable K					
Dry	0–120	121–160	161–200	201–240	240+
Field-moist and Slurry	0–50	51–85	86–120	121–155	156+
K₂O to apply (lb/acre)					
Fine Textured	130	90	40	0	0
Sandy Textured	110	70	40	0	0

*The recommended amounts of P₂O₅ and K₂O for the optimum soil test category are based on approximate nutrient removal for the harvested yield. The amounts shown in the table for the optimum soil test category are based on 180 bu corn grain per acre. Nutrient removal amounts can be adjusted higher or lower for other yield levels. In the high soil test category, banded NP or NPK starter fertilizer may be advantageous under conditions of limited soil drainage, cool soil, crop residues on the soil surface, or late planting dates with full-season hybrids.

Sulfur Management for Iowa Crop Production

ISU Extension publication CROP 3072 is available as a free pdf at:

<https://store.extension.iastate.edu/product/14280>

Sulfur Fertilizer Recommendations in a Nutshell:

For corn:

- Soil and tissue tests are not reliable.
- Consider 10-15 lb./ac on most soils, but up to 25 lb./ac on sandy soils.

For soybeans: No recommendation.

For alfalfa:

- The soil test not reliable.
- The tissue test is fairly reliable.
 - Clip the top 6-inches of ~35 stems at bud stage and send to a lab for %S plant analysis.
 - If the test is lower than 0.23% S, fertilize with S.
 - Consider 20-25 lb./ac on most soils but up to 35 lb./ac on sandy soils.

Sulfur (S) is often classified as a "secondary" essential element, mainly due to a smaller plant requirement, but also because it is less frequently applied as a fertilizer compared to nitrogen, phosphorus, and potassium. This was certainly the case in Iowa where research had not documented S deficiency or fertilization needed for optimal crop production. However, if deficient, S can have a dramatic effect on plant growth and crop productivity—more than the classification "secondary" would imply.

Before 2005, over forty years of field research with corn and soybean conducted at many locations across Iowa had measured a yield response to S application only three times out of approximately 200 trials—an indication of adequate available S supply and quite limited S deficiency. This began to change in the early 2000s as producers in northeast Iowa began to notice yellow plant foliage and reduced plant growth in areas of alfalfa fields. After investigating several potential reasons, such as plant disease, demonstration of S fertilizer application showed improved coloration and growth of alfalfa in affected areas; see example in Figure 1. Several factors for why S responses have increased include reduced deposition with precipitation, fields with no manure application, higher crop yields, and low S content in commonly applied fertilizers.

Alfalfa Response to Sulfur Fertilization
In 2005, the observations of poor alfalfa growth and production led to research trials at several northeast Iowa field sites. At each site 40 lbs S/acre applied as either ammonium sulfate or calcium sulfate (gypsum) was compared to a non-S treated control in replicated plots. The S fertilizers were applied during the first crop growth prior to harvest, and in paired locations in established alfalfa that had exhibited poor growth/coloration and alfalfa that appeared normal in growth and coloration. The alfalfa yields from those trials (Table 1) documented a large increase (doubling of yield) from the S application in the poor growth areas, but no increase in the good growth areas. This yield response was also measured in the first cutting of the second year.

Figure 1. Demonstration of S fertilizer application showing improved coloration and growth of alfalfa in affected areas.

Commercial Fertilizer Sources of Sulfur

Sulfate-sulfur fertilizers are immediately available

Dry fertilizer	Chemical formula	Fertilizer analysis	Sulfur %
Ammonium sulfate	$(\text{NH}_4)_2\text{SO}_4$	21 - 0 - 0 - 24	24
Calcium sulfate (gypsum)	CaSO_4	0 - 0 - 0 - 17	16-18
Potassium sulfate	K_2SO_4	0 - 0 - 50 - 18	18-20
Potassium-Mg sulfate	$\text{K}_2\text{SO}_4 \cdot 2\text{MgSO}_4$	0 - 0 - 22 - 23	23
Elemental sulfur	S	0 - 0 - 0 - 90	90
Initially insoluble & unavailable. Requires months to become available. Requires oxidation by soil bacteria, influenced by soil incorporation, weathering, temperature & moisture.			
Liquid fertilizer			
Ammonium thiosulfate	$(\text{NH}_4)_2\text{SO}_3$	12 - 0 - 0 - 26	26
50% sulfate-sulfur and 50% elemental sulfur.			

Table 1. Traditional view of concerning likelihood of micronutrient deficiency

Micronutrient	Soil Conditions	Most Sensitive Crops
Boron (B)	Sandy or highly weathered soils low in organic matter, drought.	Alfalfa Clovers
Copper (Cu)	Very sandy soils. Acid organic soils.	Corn Oats Wheat
Iron (Fe)	Soil pH >7.0	Soybean
Manganese (Mn)	Organic soils with pH >5.8 Mineral soils with pH >7.0	Oats Soybean Sugar beets Wheat
Molybdenum (Mo)	Sandy or very acid soils (<5.5 pH)	Legumes
Zinc (Zn)	Sandy or organic soils. Low organic matter soils due to erosion. Soil pH >7.0	Corn

Corn and Soybean Yield Responses to Micronutrient Fertilization

Antonio Mallarino, Professor, Iowa State University

Proceedings of the 26th Annual Integrated Crop Management Conference

Ames, IA, Dec.3-4, 2014

- 65 field trials with corn and soybeans on foliar fertilization with B, Cu, Mn and Zn, and soil fertilization of B, Mn and Zn did not increase grain yield at any trial.
- 25 foliar fertilization strip trials with a mixture of B, Mn and Zn showed a yield increase in one soybean field and a yield decrease in one corn field.
- In contrast to lack of grain yield response, fertilization sometimes increased micronutrient concentration of plant tissue and in grain. No yield response to the micronutrient applications suggest the previous nutrient supply was sufficient.
- Lack of grain yield responses in Iowa to fertilization of micronutrients do not allow for establishing reliable soil or tissue test interpretations.

Maximize Economic Returns to Fertilizer Inputs
